- To create a FAT32 file system, - there must be a partition for the file system - and there must be unallocated space for it -sparse space does not count for creating new partition -if you create a partition using a partition manager, it gets partition on all hard drives ****NOTE**** this is a workaround and not a supported way of creating a new partition ****STEP 1**** -launch minitool

partition wizard -if you have not done that already -right click on a hard drive (HD) in the list -select "new" -next ****STEP 2**** -select FAT32 (FAT32 partition will use the drive letter) -press space ****STEP 3**** -select unallocated space ****STEP 4**** -press [select] ****STEP 5**** -enter the beginning and ending points for the partition -ex: C:\ for the beginning point, D:\ for the ending point ****STEP 6**** -press [enter] ****STEP 7**** -press [create] -confirm ****STEP 8**** -click finish ****STEP 9**** -close minitool
partition wizard -start disk management -right click on any drive letter and select "reformat" -click on "format" and press [Next] -give a name for the file system -click on "create" ****STEP 10**** -install windows -when you reboot, you will see a new partition (if you did everything right) -use disk management to rename it windows does not recognize the file system created by minitool -create a new partition using the same wizard and enter the partitions manually -it will work for now, but minitool might not recognize it later because you did not create a partition, you will not be able to create a backup of your drive using another software
Q: Scala - String in RichTextBox should be printed in bold I have a RichTextBox and I want to print some text to it.
The text needs to be bold. The text 82157476af
